Scan Report

September 15, 2021

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Immediate scan of IP 192.168.15.6”. The scan started at Wed Sep 15 21:08:00 2021 UTC and ended at Wed Sep 15 21:36:34 2021 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.15.6	23	37	2	0	0
Total: 1	23	37	2	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level “Log” are not shown.
Issues with the threat level “Debug” are not shown.
Issues with the threat level “False Positive” are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 62 results selected by the filtering described above. Before filtering there were 485 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
192.168.15.6	SMB	Success	Protocol SMB, Port 445, User

2.1.1 High 1524/tcp

High (CVSS: 10.0)
NVT: Possible Backdoor: Ingreslock

Summary
A backdoor is installed on the remote host.

Vulnerability Detection Result

```
The service is answering to an 'id;' command with the following response: uid=0(
↪root) gid=0(root)
```

Impact
Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected isystem.

Solution:
Solution type: Workaround
A whole cleanup of the infected system is recommended.

Vulnerability Detection Method
Details: `Possible Backdoor: Ingreslock`
OID:1.3.6.1.4.1.25623.1.0.103549

. . . continues on next page . . .

. . . continued from previous page . . .

[return to 192.168.15.6]

2.1.2 High 3306/tcp

High (CVSS: 9.0)
NVT: MySQL / MariaDB weak password

Product detection result
`cpe:/a:mysql:mysql:5.0.51a`
```
Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.
↪25623.1.0.100152)
```

Summary
It was possible to login into the remote MySQL as root using weak credentials.

Vulnerability Detection Result
```
It was possible to login as root with an empty password.
```

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Detection Method
Details: `MySQL / MariaDB weak password`
OID:1.3.6.1.4.1.25623.1.0.103551
Version used: `2021-02-10T08:19:07Z`

Product Detection Result
Product: `cpe:/a:mysql:mysql:5.0.51a`
Method: `MariaDB / Oracle MySQL Detection (MySQL Protocol)`
OID: 1.3.6.1.4.1.25623.1.0.100152)

[return to 192.168.15.6]

2.1.3 High 21/tcp

High (CVSS: 7.5)
NVT: vsftpd Compromised Source Packages Backdoor Vulnerability

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

vsftpd is prone to a backdoor vulnerability.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected application.

Solution:

Solution type: VendorFix

The repaired package can be downloaded from the referenced link. Please validate the package with its signature.

Affected Software/OS

The vsftpd 2.3.4 source package is affected.

Vulnerability Detection Method

Details: `vsftpd Compromised Source Packages Backdoor Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.103185
Version used: `2018-10-25T08:39:24Z`

High (CVSS: 7.5)
NVT: FTP Brute Force Logins Reporting

Summary

It was possible to login into the remote FTP server using weak/known credentials.
As the VT 'FTP Brute Force Logins' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Result

```
It was possible to login with the following credentials <User>:<Password>
msfadmin:msfadmin
postgres:postgres
service:service
user:user
```

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Detection Method
Reports weak/known credentials detected by the VT 'FTP Brute Force Logins' (OID: 1.3.6.1.4.1.25623.1.0.108717).
Details: `FTP Brute Force Logins Reporting`
OID:1.3.6.1.4.1.25623.1.0.108718
Version used: `2021-01-21T10:06:42Z`

[return to 192.168.15.6]

2.1.4 High general/tcp

High (CVSS: 10.0)
NVT: OS End Of Life Detection

Product detection result

```
cpe:/o:canonical:ubuntu_linux:8.04
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary
OS End Of Life Detection.
The Operating System on the remote host has reached the end of life and should not be used anymore.

Vulnerability Detection Result

```
The "Ubuntu" Operating System on the remote host has reached the end of life.
CPE:                cpe:/o:canonical:ubuntu_linux:8.04
Installed version,
build or SP:        8.04
EOL date:           2013-05-09
EOL info:           https://wiki.ubuntu.com/Releases
```

Solution:
Solution type: Mitigation
Upgrade the Operating System on the remote host to a version which is still supported and receiving security updates by the vendor.

Vulnerability Detection Method
Details: `OS End Of Life Detection`
OID:1.3.6.1.4.1.25623.1.0.103674

. . . continues on next page . . .

. . . continued from previous page . . .

Version used: `2021-04-16T10:39:13Z`

Product Detection Result
Product: `cpe:/o:canonical:ubuntu_linux:8.04`
Method: `OS Detection Consolidation and Reporting`
OID: 1.3.6.1.4.1.25623.1.0.105937)

[return to 192.168.15.6]

2.1.5 High 2121/tcp

High (CVSS: 7.5)
NVT: FTP Brute Force Logins Reporting

Summary
It was possible to login into the remote FTP server using weak/known credentials.
As the VT 'FTP Brute Force Logins' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Result

```
It was possible to login with the following credentials <User>:<Password>
msfadmin:msfadmin
postgres:postgres
service:service
user:user
```

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Detection Method
Reports weak/known credentials detected by the VT 'FTP Brute Force Logins' (OID: 1.3.6.1.4.1.25623.1.0.108717).
Details: `FTP Brute Force Logins Reporting`
OID:1.3.6.1.4.1.25623.1.0.108718

[return to 192.168.15.6]

2.1.6 High 513/tcp

High (CVSS: 10.0)

NVT: rlogin Passwordless Login

Summary

The rlogin service allows root access without a password.

Vulnerability Detection Result

```
It was possible to gain root access without a password.
```

Impact

This vulnerability allows an attacker to gain complete control over the target system.

Solution:

Solution type: Mitigation

Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `rlogin Passwordless Login`

OID:1.3.6.1.4.1.25623.1.0.113766

Version used: `2020-09-30T09:30:12Z`

High (CVSS: 7.5)

NVT: The rlogin service is running

Summary

This remote host is running a rlogin service.

Vulnerability Detection Result

```
The rlogin service is running on the target system.
```

Solution:

Solution type: Mitigation

Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Insight

rlogin has several serious security problems,

- all information, including passwords, is transmitted unencrypted.
- .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)

Vulnerability Detection Method

Details: `The rlogin service is running`

OID:1.3.6.1.4.1.25623.1.0.901202

Version used: `2021-09-01T07:45:06Z`

. . . continues on next page . . .

. . . continued from previous page . . .

References

`cve: CVE-1999-0651`

[return to 192.168.15.6]

2.1.7 High 514/tcp

High (CVSS: 7.5)
NVT: rsh Unencrypted Cleartext Login

Summary

This remote host is running a rsh service.

Vulnerability Detection Result

```
The rsh service is misconfigured so it is allowing conntections without a passwo
↪rd or with default root:root credentials.
```

Solution:

Solution type: Mitigation

Disable the rsh service and use alternatives like SSH instead.

Vulnerability Insight

rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network.

Vulnerability Detection Method

Details: `rsh Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.100080
Version used: `2019-01-10T07:59:14Z`

References

[return to 192.168.15.6]

2.1.8 High 80/tcp

High (CVSS: 10.0)
NVT: TWiki XSS and Command Execution Vulnerabilities

Summary

The host is running TWiki and is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 01.Feb.2003
Fixed version:     4.2.4
```

Impact

Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.

Solution:

Solution type: VendorFix

Upgrade to version 4.2.4 or later.

Affected Software/OS

TWiki, TWiki version prior to 4.2.4.

Vulnerability Insight

The flaws are due to:

- %URLPARAM}}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack.
- %SEARCH}}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.

Vulnerability Detection Method

Details: `TWiki XSS and Command Execution Vulnerabilities`

OID:1.3.6.1.4.1.25623.1.0.800320

Version used: `2021-08-10T15:24:26Z`

```

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

Summary

Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Vulnerability Detection Result

```
We could upload the following files via the PUT method at this web server:
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
http://192.168.15.6/dav/puttest494222880.html
We could delete the following files via the DELETE method at this web server:
http://192.168.15.6/dav/puttest494222880.html
```

Impact

- Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server.
- Enabled DELETE method: This might allow an attacker to delete additional files on this web server.

Solution:

Solution type: Mitigation

Use access restrictions to these dangerous HTTP methods or disable them completely.

Affected Software/OS

Web servers with enabled PUT and/or DELETE methods.

Vulnerability Detection Method

Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files.

Details: `Test HTTP dangerous methods`

OID:1.3.6.1.4.1.25623.1.0.10498

Version used: `2021-02-15T07:14:40Z`

High (CVSS: 7.5)

NVT: phpinfo() output Reporting

Summary

Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Result

```
The following files are calling the function phpinfo() which disclose potentiall
↪y sensitive information:
http://192.168.15.6/mutillidae/phpinfo.php
http://192.168.15.6/phpinfo.php
```

Impact

Some of the information that can be gathered from this file includes:

. . . continues on next page . . .

. . . continued from previous page . . .

The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution:
Solution type: Workaround
Delete the listed files or restrict access to them.

Vulnerability Detection Method
Details: `phpinfo() output Reporting`
OID:1.3.6.1.4.1.25623.1.0.11229
Version used: `2020-08-24T15:18:35Z`

High (CVSS: 7.5)
NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.

Summary
PHP is prone to an information-disclosure vulnerability.

Vulnerability Detection Result

```
By doing the following HTTP POST request:
"HTTP POST" body : <?php phpinfo();?>
URL              : http://192.168.15.6/cgi-bin/php?%2D%64+%61%6C%6C%6F%77%5F%75%
↪72%6C%5F%69%6E%63%6C%75%64%65%3D%6F%6E+%2D%64+%73%61%66%65%5F%6D%6F%64%65%3D%6
↪F%66%66+%2D%64+%73%75%68%6F%73%69%6E%2E%73%69%6D%75%6C%61%74%69%6F%6E%3D%6F%6E
↪+%2D%64+%64%69%73%61%62%6C%65%5F%66%75%6E%63%74%69%6F%6E%73%3D%22%22+%2D%64+%6
↪F%70%65%6E%5F%62%61%73%65%64%69%72%3D%6E%6F%6E%65+%2D%64+%61%75%74%6F%5F%70%72
↪%65%70%65%6E%64%5F%66%69%6C%65%3D%70%68%70%3A%2F%2F%69%6E%70%75%74+%2D%64+%63%
↪67%69%2E%66%6F%72%63%65%5F%72%65%64%69%72%65%63%74%3D%30+%2D%64+%63%67%69%2E%7
↪2%65%64%69%72%65%63%74%5F%73%74%61%74%75%73%5F%65%6E%76%3D%30+%2D%6E
it was possible to execute the "<?php phpinfo();?>" command.
Result: <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NO
↪ARCHIVE" /></head>
```

Impact
Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

Solution:
Solution type: VendorFix
PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.
An example of the -s command, allowing an attacker to view the source code of index.php is below:
http://example.com/index.php?-s

Vulnerability Detection Method
Sends a crafted HTTP POST request and checks the response.
Details: `PHP-CGI-based setups vulnerability when parsing query string parameters from ph.`

Solution:
Solution type: VendorFix
Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later. For other products using Tomcat please contact the vendor for more information on fixed versions.

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled.
Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method

Sends a crafted AJP request and checks the response.
Details: Apache Tomcat AJP RCE Vulnerability (Ghostcat)

2.1.10 High 6697/tcp

High (CVSS: 7.5)
NVT: Check for Backdoor in UnrealIRCd

Summary

Detection of backdoor in UnrealIRCd.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Solution:

Solution type: VendorFix
Install latest version of unrealircd and check signatures of software you're installing.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Remote attackers can exploit this issue to execute arbitrary system commands within the context of the affected application.
The issue affects Unreal 3.2.8.1 for Linux. Reportedly package Unreal3.2.8.1.tar.gz downloaded in November 2009 and later is affected. The MD5 sum of the affected file is 752e46f2d873c1679fa99de3f52a274d. Files with MD5 sum of 7b741e94e867c0a7370553fd01506c66 are not affected.

Vulnerability Detection Method
Details: `Check for Backdoor in UnrealIRCd`

[return to 192.168.15.6]

2.1.11 High 5900/tcp

High (CVSS: 9.0)
NVT: VNC Brute Force Login

Summary
Try to log in with given passwords via VNC protocol.

Vulnerability Detection Result
```
It was possible to connect to the VNC server with the password: password
```

Solution:
Solution type: Mitigation
Change the password to something hard to guess or enable password protection at all.

Vulnerability Insight
This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all.
Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked.

. . . continues on next page . . .

. . . continued from previous page . . .

Note as well that passwords can be max. 8 characters long.

Vulnerability Detection Method
Details: `VNC Brute Force Login`

↪plemented
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact

By default, Distributed Ruby does not impose restrictions on allowed hosts or set the $SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.

Solution:

Solution type: Mitigation

Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:

- Implementing taint on untrusted input
- Setting $SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate)
- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts

Vulnerability Detection Method

Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.

Details: `Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities`

2.1.16 High 1099/tcp

High (CVSS: 10.0)
NVT: Java RMI Server Insecure Default Configuration Remote Code Execution Vulnerability

Summary

Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code on a targeted system with elevated privileges.

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.

Solution:

Solution type: Workaround

Disable class-loading.

Vulnerability Insight

The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.

Vulnerability Detection Method

Check if the target tries to load a Java class via a remote HTTP URL.

Details: `Java RMI Server Insecure Default Configuration Remote Code Execution Vulnerabil.`
`↪..`

2.1.17 High 512/tcp

High (CVSS: 10.0)
NVT: The rexec service is running

Summary

This remote host is running a rexec service.

Vulnerability Detection Result

```
The rexec service was detected on the target system.
```

Solution:

Solution type: Mitigation

Disable the rexec service and use alternatives like SSH instead.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer.
The main difference is that rexec authenticate by reading the username and password *unencrypted* from the socket.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `The rexec service is running`

2.1.18 High 3632/tcp

High (CVSS: 9.3)
NVT: DistCC Remote Code Execution Vulnerability

Summary
DistCC 2.x, as used in XCode 1.5 and others, when not configured to restrict access to the server port, allows remote attackers to execute arbitrary commands via compilation jobs, which are executed by the server without authorization checks.

Vulnerability Detection Result

```
It was possible to execute the "id" command.
Result: uid=1(daemon) gid=1(daemon)
```

Impact
DistCC by default trusts its clients completely that in turn could allow a malicious client to execute arbitrary commands on the server.

Solution:
Solution type: VendorFix
Vendor updates are available. Please see the references for more information.
For more information about DistCC's security see the references.

Vulnerability Detection Method
Details: `DistCC Remote Code Execution Vulnerability`

2.1.19 Medium 21/tcp

Medium (CVSS: 6.4)
NVT: Anonymous FTP Login Reporting

Summary
Reports if the remote FTP Server allows anonymous logins.

Vulnerability Detection Result

```
It was possible to login to the remote FTP service with the following anonymous
↪account(s):
anonymous:anonymous@example.com
ftp:anonymous@example.com
```

Impact
Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:
- gain access to sensitive files
- upload or delete files.

Solution:
Solution type: Mitigation
If you do not want to share files, you should disable anonymous logins.

Vulnerability Insight
A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

Vulnerability Detection Method
Details: `Anonymous FTP Login Reporting`
OID:1.3.6.1.4.1.25623.1.0.900600
Version used: `2020-08-24T08:40:10Z`

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Vulnerability Detection Result

```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Please specify the password.
Anonymous sessions:     331 Please specify the password.
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528
Version used: `2020-08-24T08:40:10Z`

[return to 192.168.15.6]

2.1.21 Medium 445/tcp

Medium (CVSS: 6.0)
NVT: Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check)

Product detection result

```
cpe:/a:samba:samba:3.0.20
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary
Samba is prone to a vulnerability that allows attackers to execute arbitrary shell commands because the software fails to sanitize user-supplied input.

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.

Solution:
Solution type: VendorFix
Updates are available. Please see the referenced vendor advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
This issue affects Samba 3.0.0 to 3.0.25rc3.

Vulnerability Detection Method
Send a crafted command to the samba server and check for a remote command execution.
Details: `Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check)`
OID:1.3.6.1.4.1.25623.1.0.108011
Version used: `2018-07-04T12:11:48Z`

Product Detection Result
Product: `cpe:/a:samba:samba:3.0.20`

2.1.22 Medium 25/tcp

Medium (CVSS: 6.8)
NVT: Multiple Vendors STARTTLS Implementation Plaintext Arbitrary Command Injection Vulnerability

Summary
Multiple vendors' implementations of 'STARTTLS' are prone to a vulnerability that lets attackers inject arbitrary commands.

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker can exploit this issue to execute arbitrary commands in the context of the user running the application. Successful exploits can allow attackers to obtain email usernames and passwords.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
The following vendors are affected:
Ipswitch
Kerio
Postfix
Qmail-TLS
Oracle
SCO Group
spamdyke
ISC

Vulnerability Detection Method
Send a special crafted 'STARTTLS' request and check the response.
Details: `Multiple Vendors STARTTLS Implementation Plaintext Arbitrary Command Injection .`

Medium (CVSS: 5.0)
NVT: Check if Mailserver answer to VRFY and EXPN requests

Summary
The Mailserver on this host answers to VRFY and/or EXPN requests.

Vulnerability Detection Result

```
'VRFY root' produces the following answer: 252 2.0.0 root
```

Solution:
Solution type: Workaround
Disable VRFY and/or EXPN on your Mailserver.
For postfix add 'disable_vrfy_command=yes' in 'main.cf'.
For Sendmail add the option 'O PrivacyOptions=goaway'.
It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.

Vulnerability Insight
VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.

Vulnerability Detection Method
Details: `Check if Mailserver answer to VRFY and EXPN requests`
OID:1.3.6.1.4.1.25623.1.0.100072

```

Solution:
Solution type: Mitigation
Replace the SSL/TLS certificate by a new one.

Vulnerability Insight
This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.

Vulnerability Detection Method
Details: `SSL/TLS: Certificate Expired`
OID:1.3.6.1.4.1.25623.1.0.103955
Version used: `2018-08-24T10:37:26Z`

Medium (CVSS: 4.3)
NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary
It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Vulnerability Detection Result

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

. . . continues on next page . . .

. . . continued from previous page . . .

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS
All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.

Vulnerability Insight
The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:
- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method
Check the used TLS protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection`

```

Medium (CVSS: 4.3)
NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

Summary
This host is accepting 'RSA_EXPORT' cipher suites and is prone to man in the middle attack.

Vulnerability Detection Result

```
'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5
'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5
```

Impact
Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:
Solution type: VendorFix
- Remove support for 'RSA_EXPORT' cipher suites from the service.
- If running OpenSSL update to version 0.9.8zd or 1.0.0p or 1.0.1k or later.

Affected Software/OS
- Hosts accepting 'RSA_EXPORT' cipher suites

. . . continues on next page . . .

. . . continued from previous page . . .

- OpenSSL version before 0.9.8zd, 1.0.0 before 1.0.0p, and 1.0.1 before 1.0.1k.

Vulnerability Insight

Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.

Vulnerability Detection Method

Check previous collected cipher suites saved in the KB.

Medium (CVSS: 4.3)
NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

This host is prone to an information disclosure vulnerability.

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:
Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight
The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method
Evaluate previous collected information about this service.

Medium (CVSS: 4.3)
NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and S
↪SLv3 protocols and supports one or more ciphers. Those supported ciphers can b
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
↪e found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256
↪23.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS

All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight

The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:

- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method

Check the used SSL protocols of the services provided by this system.

Medium (CVSS: 4.3)
NVT: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)

Summary
This host is accepting 'DHE_EXPORT' cipher suites and is prone to man in the middle attack.

Vulnerability Detection Result

```
'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
```

Impact
Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

- Remove support for 'DHE_EXPORT' cipher suites from the service
- If running OpenSSL updateto version 1.0.2b or 1.0.1n or later.

Affected Software/OS

- Hosts accepting 'DHE_EXPORT' cipher suites
- OpenSSL version before 1.0.2b and 1.0.1n

Vulnerability Insight

Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.

Vulnerability Detection Method

Check previous collected cipher suites saved in the KB.

Medium (CVSS: 4.0)
NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary
The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Vulnerability Detection Result

```
The following certificates are part of the certificate chain but using insecure
↪signature algorithms:
Subject:              1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

... continues on next page ...

. . . continued from previous page . . .

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:
- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1,Fingerprint2

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`
OID:1.3.6.1.4.1.25623.1.0.105880
Version used: `2021-02-18T11:08:41Z`

Medium (CVSS: 4.0)
NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

```
Server Temporary Key Size: 1024 bits
```

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

[return to 192.168.15.6]

2.1.23 Medium 23/tcp

Medium (CVSS: 4.8)
NVT: Telnet Unencrypted Cleartext Login

Summary

The remote host is running a Telnet service that allows cleartext logins over unencrypted connections.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

Solution:

Solution type: Mitigation

Replace Telnet with a protocol like SSH which supports encrypted connections.

Vulnerability Detection Method

Details: `Telnet Unencrypted Cleartext Login`

OID:1.3.6.1.4.1.25623.1.0.108522

Version used: `2020-08-24T08:40:10Z`

2.1.24 Medium 80/tcp

Medium (CVSS: 6.8)
NVT: TWiki Cross-Site Request Forgery Vulnerability - Sep10

Summary
The host is running TWiki and is prone to Cross-Site Request Forgery vulnerability.

Vulnerability Detection Result

```
Installed version: 01.Feb.2003
Fixed version:     4.3.2
```

Impact
Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.

Solution:
Solution type: VendorFix
Upgrade to TWiki version 4.3.2 or later.

Affected Software/OS
TWiki version prior to 4.3.2

Vulnerability Insight
Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.

Vulnerability Detection Method
Details: `TWiki Cross-Site Request Forgery Vulnerability - Sep10`

```

Medium (CVSS: 6.1)
NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is vulnerable to Cross-site Scripting (XSS) attacks.

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.9.0
Installation
path / port:       /mutillidae/javascript/ddsmoothmenu
```

Solution:
Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141636

Medium (CVSS: 5.8)
NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled

Summary
The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.

Vulnerability Detection Result

```
The web server has the following HTTP methods enabled: TRACE
```

Impact
An attacker may use this flaw to trick your legitimate web users to give him their credentials.

Solution:
Solution type: Mitigation
Disable the TRACE and TRACK methods in your web server configuration.
Please see the manual of your web server or the references for more information.

Affected Software/OS
Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight
It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method
Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.
Details: `HTTP Debugging Methods (TRACE/TRACK) Enabled`

Medium (CVSS: 5.0)
NVT: awiki Multiple Local File Include Vulnerabilities

Summary
awiki is prone to multiple local file-include vulnerabilities because it fails to properly sanitize user-supplied input.

Vulnerability Detection Result

```
Vulnerable URL: http://192.168.15.6/mutillidae/index.php?page=/etc/passwd
```

Impact
An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host. Other attacks are also possible.

Solution:
Solution type: WillNotFix

. . . continues on next page . . .

. . . continued from previous page . . .

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
awiki 20100125 is vulnerable. Other versions may also be affected.

Vulnerability Detection Method
Details: `awiki Multiple Local File Include Vulnerabilities`

Medium (CVSS: 5.0)
NVT: /doc directory browsable

Summary
The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.

Vulnerability Detection Result

```
Vulnerable URL: http://192.168.15.6/doc/
```

Solution:
Solution type: Mitigation
Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf:
<Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost </Directory>

Vulnerability Detection Method
Details: `/doc directory browsable`
OID:1.3.6.1.4.1.25623.1.0.10056
Version used: `2020-08-24T15:18:35Z`

References

```
cve: CVE-1999-0678
bid: 318
```

Medium (CVSS: 4.8)
NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Vulnerability Detection Result

```
The following input fields where identified (URL:input name):
http://192.168.15.6/phpMyAdmin/:pma_password
http://192.168.15.6/phpMyAdmin/?D=A:pma_password
http://192.168.15.6/tikiwiki/tiki-install.php:pass
http://192.168.15.6/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword
```

Impact
An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'
Details: `Cleartext Transmission of Sensitive Information via HTTP`

Medium (CVSS: 4.3)
NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Summary
The host is running phpMyAdmin and is prone to Cross-Site Scripting Vulnerability.

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 3.3.8.1 and prior.

Vulnerability Insight
The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Vulnerability Detection Method
Details: `phpMyAdmin 'error.php' Cross Site Scripting Vulnerability`

Medium (CVSS: 4.3)
NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is vulnerable to Cross-site Scripting (XSS) attacks.

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.6.3
```

. . . continues on next page . . .

... continued from previous page ...

```
Installation
path / port:        /mutillidae/javascript/ddsmoothmenu
```

Solution:

Solution type: VendorFix

Update to version 1.6.3 or later or apply the patch.

Affected Software/OS

jQuery prior to version 1.6.3.

Vulnerability Insight

Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `jQuery < 1.6.3 XSS Vulnerability`

cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a cookie information disclosure vulnerability.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.

... continues on next page ...

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to Apache HTTP Server version 2.2.22 or later.

Affected Software/OS
Apache HTTP Server versions 2.2.0 through 2.2.21.

Vulnerability Insight
The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

Vulnerability Detection Method
Details: `Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.902830
Version used: `2021-08-06T11:34:45Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.2.8`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

[return to 192.168.15.6]

2.1.25 Medium 6697/tcp

Medium (CVSS: 6.8)
NVT: UnrealIRCd Authentication Spoofing Vulnerability

Product detection result

```
cpe:/a:unrealircd:unrealircd:3.2.8.1
Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
This host is installed with UnrealIRCd and is prone to authentication spoofing vulnerability.

Vulnerability Detection Result

```
Installed version: 3.2.8.1
Fixed version:     3.2.10.7
```

Impact
Successful exploitation of this vulnerability will allows remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution:
Solution type: VendorFix
Upgrade to UnrealIRCd 3.2.10.7, or 4.0.6, or later.

Affected Software/OS
UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight
The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `UnrealIRCd Authentication Spoofing Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.809883
Version used: `2018-10-12T11:28:04Z`

Product Detection Result
Product: `cpe:/a:unrealircd:unrealircd:3.2.8.1`
Method: `UnrealIRCd Detection`

[return to 192.168.15.6]

2.1.26 Medium 5900/tcp

Medium (CVSS: 4.8)
NVT: VNC Server Unencrypted Data Transmission

Summary
The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Vulnerability Detection Result

```
The VNC server provides the following insecure or cryptographically weak Securit
↪y Type(s):
2 (VNC authentication)
```

Impact
An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution:
Solution type: Mitigation
Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method
Details: `VNC Server Unencrypted Data Transmission`
OID:1.3.6.1.4.1.25623.1.0.108529
Version used: `2020-11-10T09:46:51Z`

[return to 192.168.15.6]

2.1.27 Medium 5432/tcp

Medium (CVSS: 5.8)
NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability

Summary
OpenSSL is prone to security-bypass vulnerability.

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

Affected Software/OS
OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.

Vulnerability Insight
OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.

Vulnerability Detection Method
Send two SSL ChangeCipherSpec request and check the response.
Details: `SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.105042

Medium (CVSS: 5.0)
NVT: SSL/TLS: Report Weak Cipher Suites

Summary
This routine reports all Weak SSL/TLS cipher suites accepted by a service.
NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

Vulnerability Detection Result

```
'Weak' cipher suites accepted by this service via the SSLv3 protocol:
TLS_RSA_WITH_RC4_128_SHA
'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_RSA_WITH_RC4_128_SHA
```

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.
Please see the references for more resources supporting you with this task.

Vulnerability Insight
These rules are applied for the evaluation of the cryptographic strength:
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808).
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000).
- 1024 bit RSA authentication is considered to be insecure and therefore as weak.
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method
Details: `SSL/TLS: Report Weak Cipher Suites`
OID:1.3.6.1.4.1.25623.1.0.103440

```

Solution:
Solution type: Mitigation
Replace the SSL/TLS certificate by a new one.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.

Vulnerability Detection Method

Details: `SSL/TLS: Certificate Expired`
OID:1.3.6.1.4.1.25623.1.0.103955
Version used: `2018-08-24T10:37:26Z`

Medium (CVSS: 4.3)
NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary

This host is prone to an information disclosure vulnerability.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:

Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight

The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method

Evaluate previous collected information about this service.

Medium (CVSS: 4.3)
NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 proto
↪col and supports one or more ciphers. Those supported ciphers can be found in
↪the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020
↪67) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Check the used SSL protocols of the services provided by this system.

Medium (CVSS: 4.3)
NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary
It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS
All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.

Vulnerability Insight
The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:
- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method
Check the used TLS protocols of the services provided by this system.

Medium (CVSS: 4.0)
NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary
The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

```
Server Temporary Key Size: 1024 bits
```

Impact
An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:
Solution type: Workaround
Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).
For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

Medium (CVSS: 4.0)
NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary

The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Vulnerability Detection Result

```
The following certificates are part of the certificate chain but using insecure
↪signature algorithms:
Subject:             1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:

Solution type: Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

. . . continues on next page . . .

. . . continued from previous page . . .

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.
NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1,Fingerprint2

Vulnerability Detection Method
Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

2.1.28 Medium 22/tcp

Medium (CVSS: 4.3)
NVT: SSH Weak Encryption Algorithms Supported

Summary
The remote SSH server is configured to allow weak encryption algorithms.

Vulnerability Detection Result

```
The following weak client-to-server encryption algorithms are supported by the r
↪emote service:
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
The following weak server-to-client encryption algorithms are supported by the r
↪emote service:
3des-cbc
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
```

Solution:
Solution type: Mitigation
Disable the weak encryption algorithms.

Vulnerability Insight

The ‘arcfour‘ cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
The ‘none‘ algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method

Check if remote ssh service supports Arcfour, none or CBC ciphers.
Details: `SSH Weak Encryption Algorithms Supported`

[return to 192.168.15.6]

2.1.29 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP timestamps

Summary

The remote host implements TCP timestamps and therefore allows to compute the uptime.

Vulnerability Detection Result

```
It was detected that the host implements RFC1323/RFC7323.
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 91116
Packet 2: 91223
```

Impact

A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:

Solution type: Mitigation

To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.

To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'

Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.

The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.

See the references for more information.

Affected Software/OS

TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight

The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method

Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.

Details: `TCP timestamps`
